Human Physiology

Biology practice worksheet

Study snapshot

Connect major organ systems with the movement of materials through the body.

Key ideas

- Digestion breaks food into molecules that can be absorbed.
- The small intestine is a major site of nutrient absorption.
- The heart pumps blood through pulmonary and systemic circuits.
- Gas exchange occurs across thin respiratory surfaces in the lungs.
- Kidneys help regulate water balance and remove metabolic waste.

Try the questions on page 2 before checking your work.

Human Physiology

Quick practice

1. Where does most nutrient absorption occur?
2. Which heart chamber pumps blood to the lungs?
3. What gas moves from the alveoli into nearby capillary blood?
4. State one role of the kidneys.

Answer notes

1) Small intestine
2) Right ventricle
3) Oxygen
4) Remove waste and regulate water / ion balance

Review the method, then retry any question you missed.
